| Subject                          | Biology | Year Group | 9 | Sequence No. | 1 | Topic | Enzyme Activity |

| Retrieval   | Core Knowledge   | Student Thinking  |
|---|--|---|
| What do teachers need <b>retrieve</b> from students before they start teaching <b>new content</b> ? | What <b>specific ambitious knowledge</b> do teachers need teach students in this sequence of learning?   | What real life examples can be applied to this sequence of learning to <b>development of our students thinking, encouraging them to see the inequalities around them</b> and 'do something about them!'   |
|   | <p><b>L1: Metabolism</b> is the <b>sum of all chemical reactions in the body or single cell</b>. Addressing the misconception that <b>metabolism</b> is not <b>digestion</b> and understanding that <b>cellular reactions</b> are either <b>anabolic or catabolic</b>, with <b>anabolic</b> creating molecules and <b>catabolic</b> breaking molecules. Introduction to the <b>Krebs cycle</b> and the <b>First Law of Thermodynamics</b>, that energy is conserved and not created or destroyed. <b>Enzymes</b> introduced explaining that they <b>speed up chemical reactions</b> and will either break a molecule or form a molecule.</p> <p><b>L2:</b> Expanding knowledge on <b>enzymes</b>, that they are <b>biological catalysts</b> and so <b>speed up chemical reactions</b>. Understanding that <b>enzymes</b> are <b>highly folded proteins</b>, found in <b>every cell</b>, they <b>break molecules or form molecules, they do not change or get used up during reactions</b> and that without them we would die. Identifying the structures of an <b>enzyme</b> and being able to label a diagram with the correct terminology, <b>active site, substrate and product</b> and then explaining how this links to the <b>lock and key theory</b>.</p> <p><b>L3:</b> Expanding knowledge on <b>enzymes</b> further and understanding of the <b>lock and key theory</b>, that only one <b>substrate</b> fits into one <b>enzyme's active site</b>, just like how a key only fits one lock. Leading onto <b>enzyme active sites changing shape</b>, due to <b>extreme temperature</b> and <b>extreme pH</b> which is known as <b>denatured</b>. Defining the term <b>optimum</b>, most favourable condition.</p> <p><b>L4:</b> Retrieval of knowledge of the organs of the <b>digestive system, salivary glands, oesophagus, stomach, pancreas, liver, gall bladder, small intestine, large intestine, rectum and anus</b>. Expanding knowledge of the <b>digestive enzymes</b>, knowing <b>enzyme</b> names, what they produce and where they are produced in the body. <b>Lipase</b>, breaks down <b>lipids (fats)</b> into <b>fatty acids and glycerol</b> and it is produced in the <b>pancreas</b>. <b>Protease</b> breaks down <b>proteins into amino acids</b> and is produced in the <b>stomach</b>. <b>Amylase</b> is a <b>carbohydrase</b> which breaks down <b>carbohydrates into sugars</b> and is produced in the <b>salivary glands</b>. Retrieving previous learning on <b>bile</b>, that it <b>neutralises stomach acid</b> because it is <b>alkaline</b> and that it <b>emulsifies fats</b> into tiny droplets and that it is produced in the <b>liver</b>, stored in the <b>gall bladder</b> and</p> | <p><b>L1:</b> Introduction to the Krebs Cycle studied further at KS%. Enzymes are used in biological washing powder.</p> <p><b>L2:</b> Quoting Dr. Wolfenden and his work on enzymes, which relates to our DNA production.</p> <p><b>L3:</b> Enzymes optimum temperature in the human body is 37°C.</p> <p><b>L4:</b> Understanding what bile is in the body and enzymes in our digestive system.</p> |

|  |  |  |

|  | <p>released into the <b>small intestine</b>. Understanding effect of <b>cold temperatures on enzymes</b> that it will slow reactions down.</p> <p><b>L5:</b> GPA lesson consolidating knowledge on <b>enzymes</b>. <b>Enzymes are biological catalysts</b> and so <b>speed up chemical reactions</b>. Understanding that <b>enzymes are highly folded proteins</b>, found in <b>every cell</b>, they <b>break molecules or form molecules, they do not change or get used up during reactions</b> and that without them we would die. Identifying the structures of an <b>enzyme</b> and being able to label a diagram with the correct terminology, <b>active site, substrate and product</b> and then explaining how this links to the <b>lock and key theory</b>. One <b>substrate</b> fits into one <b>enzyme's active site</b>, just like how a key only fits one lock. Leading onto <b>enzyme active sites changing shape</b>, due to <b>extreme temperature</b> and <b>extreme pH</b> which is known as <b>denatured</b>.</p> <p><b>L6:</b> Preparation for the <b>enzyme practical</b>. Understanding that <b>amylase</b> is an <b>enzyme</b> that breaks down <b>starch into sugar</b> and using this to test how <b>different pH levels</b> will affect <b>enzyme activity</b>. <b>Iodine</b> is used to test for <b>starch</b> and will turn from an <b>orange-brown colour to a blue-black colour if starch is present</b>. Students must be aware of the <b>control variables</b> so that these <b>variables</b> do not affect the experiment, variables such as <b>temperature</b> and amount of <b>starch</b>.</p> <p><b>L7:</b> Conduct the <b>enzyme practical</b>, investigating the <b>affect of pH levels on enzyme activity</b>. Understanding the results to conclude whether <b>the enzyme has denatured or not</b> and reflecting on areas where they could improve their practical skills.</p> <p><b>L8:</b> Investigating the connection between <b>enzymes</b> and <b>decay</b>. Understanding that <b>detritivores</b> are organisms that feed on dead organic matter including faeces (<b>detritus</b>) and knowing specific examples such as a fly. Discovering <b>decomposers</b> are <b>bacteria</b> and <b>fungi</b> and that they break down molecules, using <b>enzymes</b> by <b>secreting</b> them out onto the surface of dead organisms, however they cannot break down <b>inorganic molecules</b> and this is all a part of a <b>nutrient cycle</b>. Knowing that the <b>rate of decomposition</b> can be affected by <b>temperature, oxygen availability, water availability</b> and the <b>number of decay organisms</b>, linking <b>temperature</b> into <b>enzyme activity</b>, so an <b>extreme temperature</b> will <b>denature an enzyme</b>.</p> <p><b>L9:</b> Students will undertake a research project, discovering <b>industries</b> that use <b>enzymes</b>, for example the <b>food industry, washing product industries and medical industries to prevent allergies</b>.</p> <p><b>L10:</b> Students present their findings from their research project during a presentation to the rest of the class.</p> <p>L11: EoTT<br/>L12: GPA</p> | <p><b>L8:</b> Understanding decay when an organism dies</p> <p><b>L9/L10:</b> Real world application of enzymes in industry.</p> |
